No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

blid to a zonula occludens toxin (207) receptor, yet do not care physiologically modulate the opening of mammalian tight junctions and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor combinant DNA techniques. The present peptide antagonist are based on a common motif of zor creombinant DNA techniques. The present peptide antagonist is used in a claimed method for treatment of a condition associated computed in the brain. It can be used for treatment of a condition associated computed is the brain but does not modulate the opening of my condition associated computed is the brain but does not modulate the opening of my condition associated computed is set to the convulsive setzure, chemical toxins, uraemia, meningitis, encephalomyelitis, e.g. infective, or bacterial or convulsive setzure, traumatic brain injuries, radiation brain injury, constructive, or democratic period diseases, e.g. multiple constructions or Guillian-Barre syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT

GAPD blinds to a sequence found in anti-tumour necrosis factor-alpha (TNF-alpha) ribozymes. The binding of GAPDH acts to stabilise ribozyme and has the ability to stimulate cleavage activity of hammerhead ribozymes. This increase is most likely due to the

Attachment of the second RNA is used to stabilise the first RNA, which may be a ribozyme or antisense molecule, or mRNA encoding a polypeptide, e.g. a growth hormone, blood factor, enzyme, or antigen for vaccine. The ribozymes are particularly directed against viruses (pathogenic in animals or plants), tumour necrosis factor-alpha (TNF-alpha) for treating e.g. rheumatoid arthritis, acquired immune deficiency syndrome, saptic shock, graft vs. host diseases, and cachexia or designed to treat a wide variety of other diseases such as immune dysfunction, Alzheimer's disease, psoriasis, and leukaemia and other cancers. Stabilising mRNA with the second RNA improves the production of proteins, particularly in animal cells, substantially reducing costs, and increases the effect of ribozymes or antisense molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                03-NOV-1992;

                                                                                                                                                                                                                                                                                                                                                                                                     characteristics prostate adenocarcinoma cell line inclap. Egg (ATCC CRL 1740) with human prostatitis sera. Comparison of the peptide sequences with database sequences revealed homology peptides not previously associated with human prostate. These were glyceraldehyde-3-phosphatate dehydrogenase (see W27316), alpha-human fructose biphosphate aldolase (see W27317), calreticulin (see W27318 and W27319), malate dehydrogenase (see W273120) and cystic disease fluid protein (see W27312 and W27313). Immunogenic portions of these peptides can be used in a claimed pharmaceutical composition for the treatment of prostate cancer, in a claimed vaccine for treatment of prostate cancer, or used to raise a monoclonal or polyclonal antibody useful in claimed methods or prostate cancer. 17 HPA polypeptides (see W23312-23 and W27303-07) and 14 other immunogenic polypeptides (see W23312-23 and W27303-07)

The invention relates to a new screening assay for compounds capable of inhibiting binding of GAPDH to polyglutamine. The assay comprises providing an aqueous solution containing a test compound, polyglutamine-containing molecules and GAPDH and determining if binding of GAPDH to the polyglutamine-containing molecules is reduced in the presence of the test compound. Inhibitors identified by the above assay could be used to treat neurodegenerative diseases or psychiatric disorders caused by a gene containing an extended CAG domain, e.g. Huntington's disease or schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Screening assay for inhibitors of GAPDH binding for use in treating neuro-degenerative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Burke JR, Enghild J,

The present sequence is that of the N-terminal region of foetal human brain zonulin. The N-terminal sequences of human adult and foetal zonulins (see Y79130-36) were compared with Vibrio cholerae zonula occludens toxin (207) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-brain treatment of conditions associated with breakdown of the blood-brain treatment of conditions associated with breakdown of the blood-brains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents the N-terminal of a human glyceraldehyde-3-phosphate dehydrogenase. The specification polypeptides and DNA which are obtained from prostate tumour cells. The polypeptide comprises an immunogenic portion of a
                                                                                                                                                  New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemla, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis

                                                                                   The present invention describes lung tumour specific polynucleotides and tumour antigens. 207144 to 207246 and 208301 to 208325 represent specifically claimed polynucleotides, and Y29486 to Y29571 represent amino acid sequences from the present invention. The lung tumour specific polynucleotides and polypeptides can be used in pharmaceutic compositions and vaccines to inhibit the development of lung cancer. They can also be used to detect lung cancer in a patient. Probes and
                                                                They can also be used to detect lung cancer antibodies derived from the lung tumour sequentection of lung cancer.
                                                                                                                                                               Example 3; Page 114; 171pp; English.

                    Human lung tumour protein L86S-51 predicted amino acid sequence.
                                                 13-0CT-1999
                                                                                                                                                                                                                                                                     The present sequence is given in a specification relating to compounds for therapy and diagnosis of lung cancer. Polypeptides comprising at least an immunogenic part of a lung tumour protein are disclosed. The polypeptides are useful for inhibiting the development of cancer, especially lung cancer. Samples of T cells expressing the polypeptides may be used to inhibit the development of cancer. The polypeptides are also useful for detecting and monitoring the progression of cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            02-APR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes lung tumour specific polynucleotides and tumour antigens. 207144 to 207246 and Z08301 to Z08325 represent specifically claimed polynucleotides, and Y29486 to Y29571 represent amino acid sequences from the present invention. The lung tumour specific polynucleotides and polypeptides can be used in pharmaceutical compositions and vaccines to inhibit the development of lung cancer. They can also be used to detect lung cancer in a patient. Probes and antibodies derived from the lung tumour sequences are useful in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              especially lung cancer. Samples of T cells expressing the polypeptides may be used to inhibit the development of cancer. The polypeptides are also useful for detecting and monitoring the progression of cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is given in a specification relating to compound for therapy and diagnosis of lung cancer. Polypeptides comprising at least an immunogenic part of a lung tumour protein are disclosed. The polypeptides are useful for inhibiting the development of cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          M. vaccae proteins. The M. vaccae proteins may be employed to activate T cells and natural killer cells, to stimulatory molecules on cytokines, to enhance the expression of co-stimulatory molecules on dendritic cells and monocytes, and to enhance dendritic cell maturation and function. The proteins can be expressed by standard recombinant methodology. Pharmaceutical compositions comprising the proteins or nucleic acid sequences encoding the proteins can be used for the treatment, prevention, and detection of disorders including infectious diseases, immune disorders and cancer. In particular, the compounds and methods are used for treatment of diseases of the respiratory system, such as mycobacterial infections, asthma, allergies, tuberculosis, leprosy, sarcoidosis and lung cancers, and disorders of the skin such as psoriasis, atopic dermatitis, eszema, allergic contact dermatitis, eszema, allergic contact dermatitis,

The invention relates to a method for diagnosing a disorder characterised CC by expression of a human cancer associated antigen precursor coded for by CC a nucleic acid molecule (NAM). The method comprises: (a) contacting a CC binds to the NAM, an expression product or a fragment that specifically CC binds to the NAM, an expression product or a fragment of an expression CC interaction between the agent and the NAM or the expression product as a CC interaction between the disorder. The products and methods can be used in CC determination of the disorder. The products and methods can be used in CC the diagnosis, monitoring, research, or treatment of conditions CC characterised by the expression of various cancer associated antigens. CC which are cancer associated antigen precursors expressed in human breast CC which are cancer associated antigen precursors expressed in human breast CC cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and CC cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

A.;Title: Specific purification of 91yceraldehyde-3-phosphate dehydrogenase by hydroph A;Reference number: S03922; MUID:89229261
A;Accession: S03922
A;Molecule type: protein
A;Rolecule type: protein
A;Residues: 1-7;31-34 <KRA>
A;Experimental source: heart muscle
A;Experimental source: heart muscle
A;Note: the authors suggest that this protein differs from the form in liver
A;Note: the last four amino acids of this sequence were determined by carboxypeptidas
C;Superfamily: glyceraldehyde-3-phosphate dehydrogenase
C;Keywords: gluconeogenesis; glycolysis; homotetramer; NAD; oxidoreductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A;Experimenta C., R;Hsu, S.C.; Molday, R.S.
